## Abstract

For challenging numerical problems, William Kahan has said that "default evaluation in Quad is the humane option" for reducing the risk of embarrassment due to rounding errors. Fortunately the gfortran compiler now has a real (16) datatype. This is the humane option for producing Quad-precision software. It has enabled us to build a Quad version of MINOS.

The motivating influence has been increasingly large LP and NLP problems arising in systems biology. Flux balance analysis (FBA) models of metabolic networks generate multiscale problems involving some large data values in the constraints (stoichiometric coefficients of order 10,000 ) and some very small values in the solution (chemical fluxes of order $10^{-10}$ ). Standard solvers are not sufficiently accurate, and exact simplex solvers are extremely slow. Quad precision offers a reliable and practical compromise even via software. On a range of multiscale LP examples we find that 34-digit Quad floating-point achieves primal and dual infeasibilities of order $10^{-30}$ when "only" $10^{-15}$ is requested.

## Motivation

## Stoichiometric matrices $S$

$$
2 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}
$$

|  | $\cdot$ | $\cdot$ | $\cdot$ | $W$ | $\cdot$ | $\cdot$ | $\cdot$ |
| :---: | ---: | :---: | :---: | ---: | :---: | :---: | :---: |
| $\mathrm{H}_{2}$ | $\cdot$ | $\cdot$ | $\cdot$ | -2 | $\cdot$ | $\cdot$ | $\cdot$ |
| $\mathrm{O}_{2}$ | $\cdot$ | $\cdot$ | $\cdot$ | -1 | $\cdot$ | $\cdot$ | $\cdot$ |
| $\mathrm{H}_{2} \mathrm{O}$ | $\cdot$ | $\cdot$ | $\cdot$ | 2 | $\cdot$ | $\cdot$ | $\cdot$ |

chemicals $\times$ reactions

$62000 \times 77000$

In Constraint Based Reconstruction and Analysis (COBRA), a biochemical network, which is inherently multiscale, is represented by a stoichiometric matrix $S$ with $m$ rows corresponding to metabolites (chemicals) and $n$ columns representing reactions. Mathematically, $S$ is part of the ODE that governs the time-evolution of concentrations in the network:

$$
\begin{equation*}
\frac{d}{d t} x(t)=\operatorname{Sv}(t) \tag{1}
\end{equation*}
$$

where $x(t) \in \mathbf{R}^{m}$ is a vector of time-dependent concentrations and $v(t) \in \mathbf{R}^{n}$ is a vector of reaction fluxes. With the objective of maximizing growth rate at steady state, the following LP is constructed:

$$
\begin{array}{cl}
\max _{v} & c^{T} v \\
\text { s.t. } & S v=0 \\
& l \leq v \leq u \tag{2c}
\end{array}
$$

where growth is defined as the biosynthetic requirements of experimentally determined biomass composition, and biomass generation is a set of reaction fluxes linked in the appropriate ratios.

## ME models (FBA with coupling constraints)

Flux Balance Analysis (FBA) has been used by Ines2012ME for the first integrated stoichiometric multiscale model of metabolism and macromolecular synthesis for Escherichia coli K12 MG1655. The model modifies (2) by adding constraints that couple enzyme synthesis and catalysis reactions to (2b). Coupling constraints of the form
become linear constraints

$$
\begin{equation*}
c_{\min } \leq \frac{v_{i}}{v_{j}} \leq c_{\max } \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
c_{\min } v_{j} \leq v_{i}, \quad v_{i} \leq c_{\max } v_{j} \tag{4}
\end{equation*}
$$

for various pairs of fluxes $v_{i}, v_{j}$. They are linear approximations of nonlinear constraints and make $S$ in (2b) even less well-scaled because of large variations in reaction rates. Quad precision is evidently more appealing in this case.

## Coupling constraints

Two fluxes could be related by

$$
\begin{equation*}
0.0001 \leq \frac{v_{1}}{v_{2}} \leq 10000 \tag{5}
\end{equation*}
$$

Lifting approach: due to Yuekai Sun, ICME
We can decompose these constraints into sequences of constraints involving auxiliary variables with reasonable coefficients. If the second inequality in (5) were presented to our implementation as $v_{1} \leq 10000 v_{2}$, we would transform it to two constraints involving an auxiliary variable $s_{1}$ :

$$
\begin{equation*}
v_{1} \leq 100 s_{1}, \quad s_{1} \leq 100 v_{2} . \tag{6}
\end{equation*}
$$

If the first inequality in (5) were presented as $v_{1} \geq 0.0001 v_{2}$, we would leave it alone, but the equivalent inequality $10000 v_{1} \geq v_{2}$ would be transformed to

$$
v_{2} \leq 100 s_{2}, \quad s_{2} \leq 100 v_{1}
$$

## The desirability of Quad precision

"Carrying somewhat more precision in the arithmetic than twice the precision carried in the data and available for the result will vastly reduce embarrassment due to roundoff-induced anomalies."
"Default evaluation in Quad is the humane option."

## Methods for achieving Quad precision

Hand-code calls to auxiliary functions
Even $q=$ qdotdd $(v, w)$ needs several double functions twosum, split, twoproduct sum2, dot2
to compute double $\mathrm{x}, \mathrm{y}$
and hence quad result $\mathrm{q}=$ quad $(\mathrm{x})+$ quad $(\mathrm{y})$
Double-double datatype ( $\approx 32$ digits)
QD: http://crd-legacy.lbl.gov/~dhbailey/mpdist/
C++ with interfaces to $\mathrm{C}++$ and F 90
DDFUN90: entirely F90
Minor changes to source code
Quad datatype ( $\approx 34$ digits)
Some f90 compilers such as gfortran
Again minor changes to source code
We use this humane approach to quad implementation

## System and Methods

## quadMINOS

The GNU GCC compilers make Quad available via 128-bit data types. We have therefore been able to make a Quad version of the Fortran 77 linear and nonlinear optimization solver MINOS using the gfortran compiler ${ }^{1}$ with real (8) changed to real(16) everywhere.

Double is implemented in hardware, while Quad is a software library.
Our aim is to explore combined use of the Double and Quad MINOS simplex solvers for the solution of large multiscale linear programs. We seek greater efficiency than is normally possible with exact simplex solvers.

[^0]
## quadSNOPT

In the f90 implementations of SQOPT and SNOPT, we select one of the modules

```
snPrecision32.f90
snPrecision64.f90
snPrecision128.f90
```

For example, snPrecision128.f90:

```
module snModulePrecision
    implicit none
    public
    integer(4), parameter :: ip = 8, rp = 16 ! quad precision
end module snModulePrecision
```

Later:

```
module sn501p
    use snModulePrecision, only : ip, rp
    subroutine s5solveLP ( x, y )
    real(rp), intent(inout) :: x(nb), y(nb)
```

## MINOS and quadMINOS

The primal simplex solver in MINOS includes

- geometric-mean scaling of the constraint matrix
- the EXPAND anti-degeneracy procedure
- partial pricing (but no steepest-edge pricing, which would generally reduce total iterations and time)
- Basis LU factorizations and updates via LUSOL

## Multiscale NLPs

## Systems biology FBA problems with variable $\mu$ (Palsson Lab, UC San Diego, 2014)

Analog filter design for a personalized hearing aid (Jon Dattorro, Stanford, 2014)

## ME models with nonlinear constraints

As coupling constraints are often functions of the organism's growth rate $\mu$, Lerman et al. (UCSD) consider growth-rate optimization nonlinearly with the single $\mu$ as the objective instead of via a linear biomass objective function. Nonlinear constraints of the form
represented as

$$
\begin{equation*}
\frac{v_{i}}{v_{j}} \leq \mu \tag{7}
\end{equation*}
$$

$$
\begin{equation*}
v_{i} \leq \mu v_{j} \tag{8}
\end{equation*}
$$

are added to (2b), where $v_{i}, v_{j}, \mu$ are all variables. Constraints (8) are linear if $\mu$ is fixed at a specific value $\mu_{k}$. Lerman et al. employ a binary search to find the largest $\mu_{k} \in\left[\mu_{\text {min }}, \mu_{\text {max }}\right]$ that keeps the associated LP feasible. Thus, the procedure requires reliable solution of a sequence of related LPs.

\begin{aligned}
& \max \mu \quad \max \mu \\
& \text { st } \mu A x+B x=0 \\
& S x \quad=b \quad \equiv \\
& \text { bounds on } x \\
& \text { st } \mu A x+w=0 \\
& B x-w=0 \\
& S x=b \\
& \text { bounds on } x \text {, no bounds on } w
\end{aligned}
$$

- Tiny example: $\approx 2500 \times 3000$
- $\mu=x_{1}$ and the first columns of $A, B$ are empty
- Constraints are linear if $\mu$ is fixed 25 LP subproblems would give 8 digits
suggests binary search on sequence of LPs (really need quad Simplex)
- Instead, apply quad MINOS LCL method = Linearly Constrained Lagrangian 6 NLP subproblems (with linearized constraints) give 20 digits

## Quadratic convergence of major iterations (Robinson 1972)

## Analog filter design

Hearing aid design, Jon Dattorro, Stanford

Frequencies $\omega=2 \pi[30,45, \ldots, 12000,16000]$
Data $\quad g=[1,1.3, \ldots, 44.7,79.4]$ (filter magnitudes)
Variables $\quad U, V, u, v \geq 0$

$$
\begin{array}{ll}
U_{i}(u) \equiv 1+u_{1} \omega_{i}^{2}+u_{2} \omega_{i}^{4}+\cdots+u_{\eta} \omega_{i}^{2 \eta} & \eta=2,3, \ldots, 8 \\
V_{i}(v) \equiv 1+v_{1} \omega_{i}^{2}+v_{2} \omega_{i}^{4}+\cdots+v_{\eta} \omega_{i}^{2 \eta} &
\end{array}
$$

Find $u, v$ so that $\frac{V_{i}}{U_{i}} \approx g_{i}^{2} \Rightarrow g_{i}^{2} \frac{U_{i}}{V_{i}} \approx 1$

## Analog filter design

NLP1 | $\operatorname{minimize}_{\beta \geq 1, U, v \geq 0, u, v} \beta$ |
| :--- |
| subject to |$\frac{1}{\beta} \leq g_{i}^{2} \frac{U_{i}}{V_{i}} \leq \beta, \quad \omega_{i} \in \Omega$

where

$$
\begin{aligned}
& U_{i}(u) \equiv 1+u_{1} \omega_{i}^{2}+u_{2} \omega_{i}^{4}+\cdots \\
& V_{i}(v) \equiv 1+v_{1} \omega_{i}^{2}+v_{2} \omega_{i}^{4}+\cdots
\end{aligned}
$$

19 frequencies $\omega_{i}(\mathrm{~Hz})$ :

$$
\begin{aligned}
\omega= & 2 \pi\left[\begin{array}{llllllllllll}
30 & 45 & 60 & 90 & 125 & 187 & 250 & 375 & 500 & 750 & \ldots & \\
& 1000 & 1500 & 2000 & 3000 & 4000 & 6000 & 8000 & 12000 & 16000
\end{array}\right]^{\mathrm{T}}
\end{aligned}
$$

19 filter magnitudes:

$$
g=\left[\begin{array}{lllllllllll}
1 . & 1.2589 & 2.2387 & 2.5119 & 2.8184 & 5.0119 & 5.0119 & 7.9433 & 10 . & 6.3096
\end{array} \cdots\right.
$$

## Analog filter design

| $\operatorname{minimize}$ <br> $\beta \geq 1, U, V \geq 0, u, v$ <br> subject to | $\beta$ |
| :---: | :--- |
|  | $\beta V_{i}-\gamma_{i} U_{i} \geq 0, \quad \omega_{i} \in \Omega$ |
|  | $\beta U_{i}-\gamma_{i}^{-1} V_{i} \geq 0$ |
|  | $U_{i}-\omega_{i}^{2} u_{1}-\omega_{i}^{4} u_{2}=1$ |
|  | $V_{i}-\omega_{i}^{2} v_{1}-\omega_{i}^{4} v_{2}=1$ |

$\gamma_{i} \equiv g_{i}^{2}, \quad \beta, U_{i}, V_{i}$ appear nonlinearly
$\beta \equiv \beta_{0}$ fixed $\quad \Rightarrow$ the problem is an LP
$\Rightarrow$ can do binary search with LP solver (CVX, Gurobi)

Proof for bisection of a quasiconcave monotonic function:
p210 Dattorro 2015,
Convex Optimization $\dagger$ Euclidean Distance Geometry 2 $\epsilon$, Meboo http://stanford.edu/group/SOL/Books/0976401304.pdf

Filter design, $\eta=2$
With $\beta \equiv \beta_{0}=5.0$ fixed, the problem is an LP
The LP and NLP2 solve as follows:

|  | major itns | minor itns | $\mathrm{f} / \mathrm{g}$ evaluations | Pinf | Dinf |
| :--- | :---: | :---: | :---: | :---: | :---: |
| LP | 3 | 9 | 7 | - | -23 |
| NLP2 | 13 | 33 | 79 | - |  |
| $\beta=2.7837077182$, | $u_{1}=1.333433 \times 10^{-6}$, | $u_{2}=0.0$ |  |  |  |
|  |  | $v_{1}=4.853544 \times 10^{-5}$, | $v_{2}=2.942739 \times 10^{-13}$ |  |  |

Improvement if the frequencies $\omega_{i}$ are measured in kHz instead of Hz :

|  | major itns | minor itns | $\mathrm{f} / \mathrm{g}$ evaluations | Pinf | Dinf |
| :--- | :---: | :---: | :---: | :---: | :---: |
| LP | 2 | 8 | 5 |  |  |
| NLP2 | 12 | 19 | 39 | - | -31 |

$$
\beta=2.7837077182, \quad \begin{array}{ll}
u_{1}=1.333433 \times 10^{-0}, & u_{2}=0.0 \\
v_{1}=4.853544 \times 10^{+1}, & v_{2}=2.942739 \times 10^{-1}
\end{array}
$$

Filter design, $\eta=2: 8$

| $\eta$ | $\beta_{0}$ | $\beta^{*}$ | Pinf | Dinf |
| :---: | :--- | :---: | :---: | :---: |
| 2 | 5.0 | 4.2368 | -30 | -32 |
| 3 | 5.0 | 2.5154 | -32 | -33 |
| 4 | 3.0 | 1.4227 | -30 | -34 |

## Conclusions

## Conclusions

Just as double-precision floating-point hardware revolutionized scientific computing in the 1960s, the advent of quad-precision data types (even in software) brings us to a new era of greatly improved reliability in optimization solvers.

## Reference

## FAQ

- Is quadMINOS available?

Yes, in the openCOBRA toolbox http://opencobra.github.io/cobratoolbox/

- Can quadMINOS be called from Matlab or Tomlab? Yes via system call (not Mex)
- Is quadMINOS available in GAMS?

Soon Yes

- How about AMPL?

No, but should be feasible

- Is there a quadSNOPT? Yes, in f90 SNOPT9 we can change 1 line
- Can CPLEX / Gurobi / Mosek / ...help? Yes, they can provide Presolve and Warm start, especially from GAMS
- Will Quad hardware eventually be standard?

We hope so
